

Analysis of 2015-16 NBA Season

Nathaniel Ginck

Monte Carlo Simulation

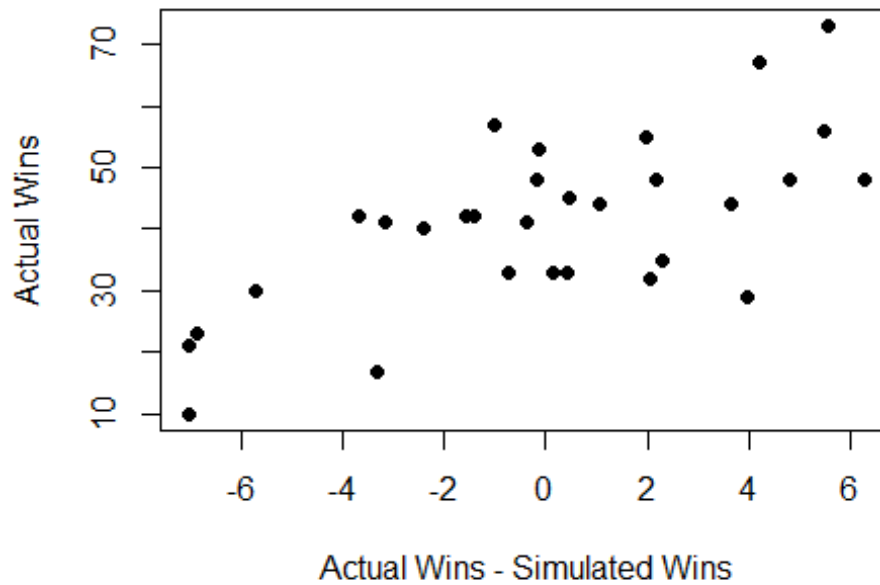

First, the starting Elo was calculated for each team using every game prior to the 2015 season. At the end of each season, each team's Elo was regressed 1/3 towards 1500. After this preparation, the season was simulated 10,000 times, taking into account home field advantage. Here is the result of this simulation:

	team	starting_elo	ending_elo	actual_wins	average_wins	division_titles	resid

Analysis

The biggest overachiever in the 2015-2016 NBA season was the Charlotte Hornets, with a residual of 6.27, meaning they outperformed the model's average by just over 6 wins. The biggest underachiever was the Brooklyn Nets, with a residual of -7.032, meaning they had 7 less wins than the model predicted. In general, there is a moderately positive relationship between residuals and actual win totals. This means that teams that performed worse in the simulation tended to underachieve what the model predicted. Similarly, teams that did well in the simulation generally overpredicted what the model predicted.

This simulation was generally accurate in replicating teams' wins totals throughout the season. There is a strong positive correlation between actual wins and predicted wins, without any real outliers in this trend. The largest residual was 7, meaning that all predictions were within 7 wins of the actual count. For a game with an 82-game season, this model was impressively accurate. Additionally, this model accurately predicted the Warriors, Spurs, Cavaliers, Thunder, and Raptors as the division winners, missing only the Miami Heat.
